# Simulation of Powder Spreading Process for Binder Jetting Additive Manufacturing

*Guanxiong Miao, Wenchao Du, Zhijian (ZJ) Pei, Chao Ma*

*Texas A&M University, College Station, TX 77843*

# Introduction

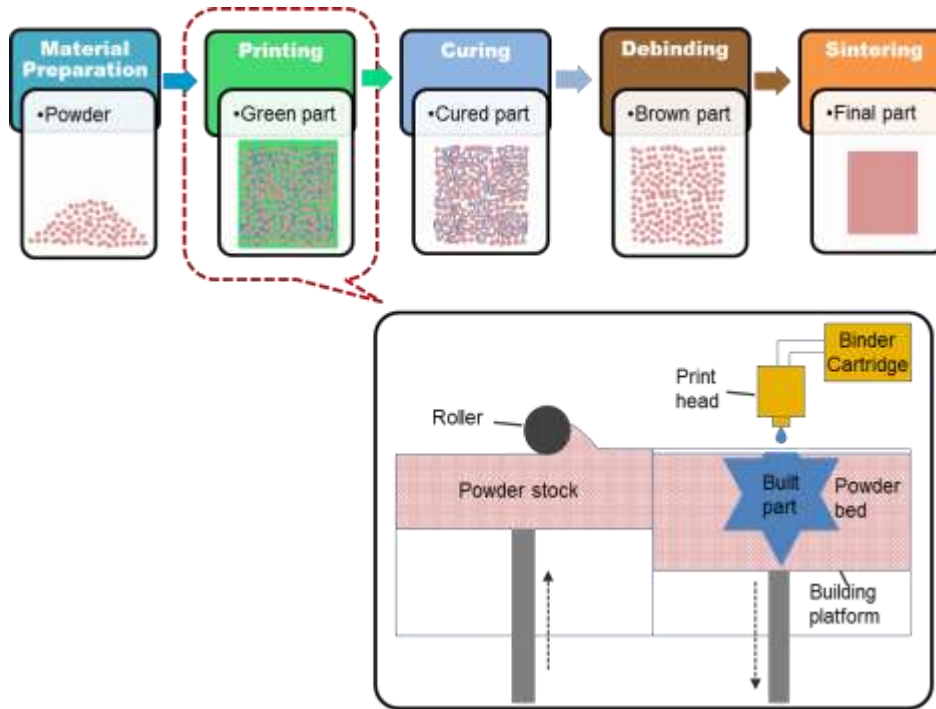

Figure 1. Binder Jetting Printing Process and Printer

- Binder jetting (BJ) has little shape and material limitation, and is easy to scale up.
- Powder spreading is an important part of BJ and will affect the powder bed density and final part density.
- Simulation of powder spreading process can provide guidance for print setting optimization, printer design, and materials development.

# Discrete Element Method (DEM)

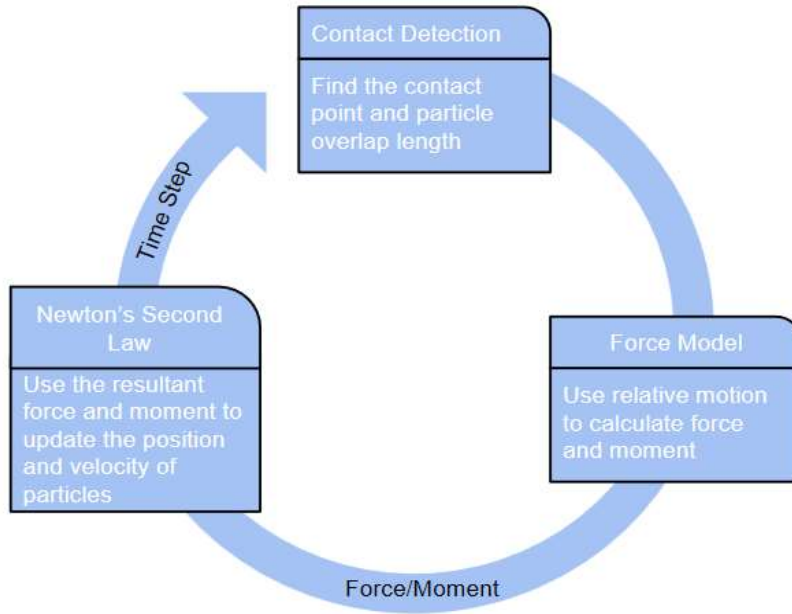

Figure 2. DEM Simulation Flowchart

- Discrete element method is a numerical method used to compute the motion and forces of a large number of individual particles.
- In each time step, the position, velocity, and force (acceleration) of every individual particle will be calculated and updated.
- This is a proper method to simulate the behavior of powder materials used for binder jetting printing.

# Model Setup

Figure 3. DEM Simulation Setup

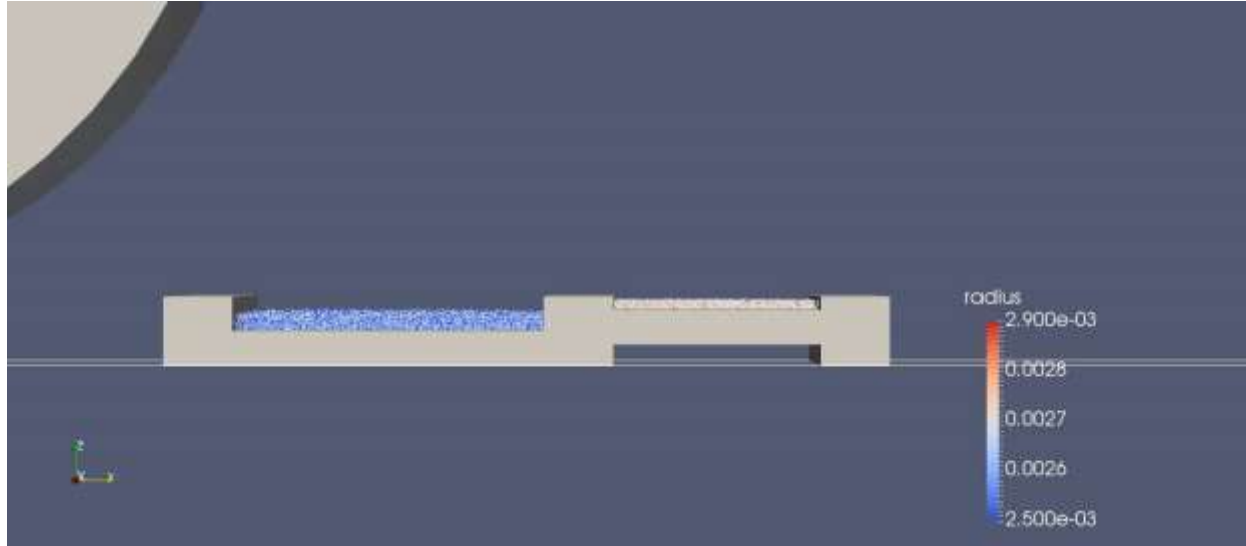

## Input parameters

- Particle size distribution
- Particle material
- Roller shape and size
- Roller translational speed
- Roller rotating speed
- Layer thickness

## Output parameters

- Particle stress
- Packing density

# Simulation Result

- Software: LIGGGHTS
- Cluster: Ada
- Number of cores: 8
- Memory: 5000 MB/core
- Run time: 48 h

# Future Directions

- Validate the simulation result using the commercial Microjet ComeTrue T10 binder jetting printer
- Study the spreading behaviors of crushable granules
- Predict the particle stress and guide the powder preparation process
