# Introduction to MATLAB® Programming

#### **Jian Tao**

jtao@tamu.edu

Fall 2017 HPRC Short Course

10/03/2017

## **Relevant Short Courses and Workshop**

#### Introduction to the MATLAB Parallel Toolbox

https://hprc.tamu.edu/training/matlab\_parallel\_toolbox.html Student Computing Center (SCC) 4.210F on Tuesday, October 10, 2:30 p.m. - 3:55 p.m.

#### **Python for MATLAB Users**

https://hprc.tamu.edu/training/python\_matlab.html

Student Computing Center (SCC) 4.210F on Thursday, October 19, 2:30 p.m. - 3:55 p.m.

#### **Bring-Your-Own-Code Workshop**

https://coehpc.engr.tamu.edu/byoc/

Offered regularly

#### What is MATLAB?

MATLAB is a powerful software tool for:

- Performing mathematical computations and signal processing
- Analyzing and visualizing data (excellent graphics tools)
- Modeling physical systems and phenomena
- Testing engineering designs
- https://www.mathworks.com/help/matlab/index.html

## **Industry Applications - I**

- Aircraft/Defense: control and guidance system design and simulation, communications
- Robotics: design and control
- Automotive: cruise control, stability enhancement, fuel injection systems, hybrid power-train, sound suppression ...
- **Communications:** voice over internet, cell-phone, satellite, antenna design, wireless, error coding ...
- **Biotech**, **Pharmaceutical**, **Medical**: drug discovery and development, imaging procedures, cancer diagnosis ...

## **Industry Applications - II**

- Electronics: chip design, acoustics, voice processing and recognition
- Industrial Automation and Machinery: sensor design, machinery design and control
- Utilities and Energy: power conversion and control
- **Computers:** security systems, printer design
- Financial: portfolio management and risk, commodity trading, currency markets

Ready

**А**М

Texas A&M University High Performance Research Computing – https://hprc.tamu.edu

#### **MATLAB Desktop**

- The Command Window is where you type MATLAB commands following the prompt: >>
- The Workspace Window shows all the variables you have defined in your current session. Variables can actually be manipulated within the workspace window.
- The Current Folder window displays all the files in whatever folder you select to be current.

# MATLAB as an Advanced Calculator

Arithmetic Operators and Order of Operations

Some Examples:

## Arithmetic Operators and Order of Operations

- Addition (+), Subtraction (-), Multiplication (\*), Division (/), Power (^)
- Order of Operations (same rules you should already know from math class and using a calculator)
  - 1. Complete all calculations inside parentheses or

brackets using the precedent rules below

- 2. Powers (left to right)
- 3. Multiplication and Division (left to right)
- 4. Addition and Subtraction (left to right)

#### Variables - I

All MATLAB variables are multidimensional arrays, no matter what type of data.

>>who % list current variables >>b = 1 % a scalar - 1x1 array >>whos b % same as who but with more info. >>c = [1,2,3;4,5,6;7,8,9] % a matrix - 3x3 array >>whos c

#### Variables - II

You can create your own variables.

What do you see in your workspace window?

Now try this: >> area = pi\*radius^2 What do you see in your workspace window now?

## Naming Rules for Variables - I

- Variable names must begin with a letter
   >4c = 12
- Names can include any combinations of letters, numbers, and underscores

 $>>c_4 = 12$ 

- Maximum length for a variable name is 63 characters
- MATLAB is case sensitive. The variable name A is different than the variable name a.

## **Naming Rules for Variables - II**

 Avoid the following names: i, j, pi, and all built-in MATLAB function names such as length, char, size, plot, break, cos, log, ...

> >>clear >>i^2 >>j^2

It is good programming practice to name your variables to reflect their function in a program rather than using generic x, y, z variables.

## **Creating Variables & Assigning Values**

At the MATLAB command prompt (>>) type:

x = 10.57;

What happens? (Hint: look at workspace window) Several things happen with this simple MATLAB command:

- A variable, **x**, of type double is created
- A memory location for the variable **x** is assigned
- The value **10.57** is stored in that memory location called **x**.

#### **Creating Variables & Assigning Values**

At the MATLAB command prompt (>>) type:

x = 73.65

What happens?

The old value for x (10.57) is replaced by the new value (73.65)
Also, since the semicolon was left off the end, we see the result in the command window (as well as in the workspace window)

#### Exercise

In MATLAB create two variables: a = 4 and b = 17.2

# Now use MATLAB to perform the following set of calculations:

$$(b+5.4)^{1/3}$$
  $b^2-4b+5a$ 

## **Creating Strings (Text Variables)**

Variables do not have to be numbers. At the MATLAB command prompt type:

- >> month = 'Aug'
- >> name = 'Adam'
- >> months = {'Aug', 'Sep', 'Oct'} %cell array
- >> names = ["Adam", "Bob", "John"] %string array
  >> whos

## **Displaying Variables**

We can display a variable (i.e., show its value) by simply typing the name of the variable at the command prompt (leaving off the semicolon).

We can also use a function called **disp** to display variables. Type the following commands at the command prompt:

>> disp('The value of x is:'); disp(x)

#### **Numeric Data Types**

#### Unless you specify otherwise, all numbers in MATLAB are stored as doubles.

Name	Description	Range
double	64 bit floating point	-1.79769313486232E308 to -4.94065645841247E-324 4.94065645841247E-324 to 1.79769313486232E308
single	32 bit floating point	-3.402823E38 to -1.401298E-45 1.401298E-45 to 3.402823E38
uint8	8 bit unsigned integer	Integers from 0 to 255
int8	8 bit signed integer	Integers from -128 to 127
uint16	16 bit unsigned integer	Integers from 0 to 65535
int16	16 bit signed integer	Integers from -32768 to 32767
uint32	32 bit unsigned integer	Integers from 0 to 4294967295
int32	32 bit signed integer	Integers from -2147483648 to 2147483647

#### Integer Data Types: int8, uint8, int16, uint16, int32, uint32

- These data types work for integers as long as the integers don't exceed the range for the data type chosen.
- They take up less memory space than doubles.
- They don't work for non-integers. If you create a variable that is an int8 and try to assign it a value of 14.8, that variable will be assigned a value of 15 instead (closest integer within the range).
- One common application for integer data types is image data (jpeg, png, ...)

# Why should I care how data is stored in a computer?

Perform each of the following calculations in your head.

$$a = 4/3$$
  
 $b = a - 1$   
 $c = 3*b$ 

#### What does MATLAB get?

# Why should I care how data is stored in a computer?

What does MATLAB get?

>>a = 4/3 = 1.3333
>>b = a - 1 = 0.3333
>>c = 3\*b = 1.0000
>>e = 1 - c = 2.2204e-016

It is not possible to perfectly represent all real numbers using a finite string of 1s and 0s.

#### **ASCII Code**

When you press a key on your computer keyboard, the key that you press is translated to a binary code.

- A = 1000001 (Decimal = 65)
- a = 1100001 (Decimal = 97)
- 0 = 0110000 (Decimal = 48)

# **ASCII Code**

#### ASCII stands for American Standard Code for Information Interchange

## **Strings in MATLAB**

- MATLAB stores strings as an array of characters using the ASCII code.
- Each letter in a string takes up two bytes (16 bits) and the two bytes are the binary representation of the decimal number listed in the ASCII table.
  - >> month = 'August'
  - >> whos
  - >> double(month)
  - >> whos

## **Some Useful Math Functions**

Function	<b>MATLAB®</b>		Function	<b>MATLAB</b> <sup>®</sup>	
cosine	cos or cosd		square root	sqrt	
sine	sin or sind		exponential	exp	
tangent	tan or tand		logarithm (base 10)	log10	
cotangent	cot or cotd		natural log (base e)	log	
arc cosine	acos or acosd		round to nearest integer	round	
arc sine	asin or asind		round down to integer	floor	
arc tangent	atan or atand		round up to integer	ceil	
arc cotangent	acot or acotd				

**Note:**  $cos(\alpha)$  assumes  $\alpha$  in radians; whereas,  $cosd(\alpha)$  assumes  $\alpha$  in degrees. acos(x) returns the angle in radians; whereas, acosd(x) returns the angle in degrees.

#### **Other Notes about Variables**

- clear clears all variables in the MATLAB workspace.
- clear a, b just clears variables a & b.
- clc clears the command window
- save MYFILE.mat saves data for later usage in a compressed file with a .mat extension.
- load MYFILE.mat loads data from the .mat file to your current workspace.

## Help & Doc

- The help & doc commands provide information about a function. Type help cos or doc cos at the command prompt. This only works if you know the name of the function you want help with.
- doc opens the function document in a separate window.
- help shows an abbreviated text version of the function documentation in the Command Window.

## **Arrays & Matrices**

#### **Create an Array**

To create an array with four elements in a single row, separate the elements with either a comma (,) or a space.

>>	a =	[1	2	3	4	5	6	7	8	9]
	-	F 4	~	~		~	~	-	~	~ 7

- >> b =  $[1 \ 2 \ 3; 4 \ 9 \ 6; 7 \ 8 \ 9]$
- >> c = zeros(3,3)
- >> d = ones(3,3)
- >> e = magic(8)
- >> f = 0:10:100
- >> g = rand(3, 5)
- >> h = eye(5)

#### **Array & Matrix Operations - II**

MATLAB allows you to process all of the values in a matrix using a single arithmetic operator or function.

>> b + 10 %	add 10 to	each element
-------------	-----------	--------------

- >> sin(b) %sin function
- >> b' %transpose
- >> inv(b) %inverse
- >> b\*inv(b) %matrix multiplication
- >> b.\*b %element-wise multiplication

>> b.^2 %element-wise square

#### **Array & Matrix Operations - II**

The pair of square brackets [] is the concatenation operator.

>>B\_H = [b, b] %horizontal concatenation >>B\_V = [b; b] %vertical concatenation >>whos

The most common way to refer to a particular element in an array is to specify row and column subscripts.

>>e(3, 5) >>e(1:3, 5) >>e(3, :)

## 2D & 3D Plots

# **Simple Line Plot**

To create two-dimensional line plots, use the **plot** function.

```
>>x = 0:pi/100:2*pi;
>>y = sin(x);
>>plot(x,y)
```

## **A More Complicated Plot**

## **Simple 3D Plot**

3D plots typically display a surface defined by a function in two variables, z=f(x,y).

>>[x,y] = meshgrid(-2:.2:2);
>>z = x .\* exp(-x.^2 - y.^2);
>>figure %new figure window
>>surf(x,y,z)

# **Subplots**

## **Script Files**

# **Script Files**

- All of the pre-built commands that you use in MATLAB are script files or functions (plot, mean, std, exp, cosd, ...)
- MATLAB allows the user to create his/her own customized m-files for specific applications or problems.
- A script file is simply a collection of executable MATLAB commands. To create a new script file, click on the New Script icon on the left side of the Home Tab.

#### **Script Files**

Select a file to view details	Reference page for cosd	-	

#### **Script File: Procedure**

- 1. Type a set of executable commands in the editor window.
- 2. Save the file in an appropriate folder. When you pick a name for the file you must follow the same rules that MATLAB has for naming variables.
- 3. To run the script file:
  - a. hit the green Run Arrow in the toolbar
    - or
  - b. type the name of the file (without the .m extension) at the command prompt in the MATLAB command window.

#### **Exercise : New Script File**

- Right click in the current folder window in MATLAB and create a new folder named whatever you would like.
- Double click on the folder to make it your current folder.
- Clear your MATLAB workspace by typing clear at the command prompt.
- Click on New Script to open a blank script file.
- Write a script to calculate the area of a circle with a radius of 4cm.
- Run the script with the green arrow button & in the command window.

#### A Bit More about Script Files

- Comments start with %
- A new script can be created in the Command Window with

#### >>edit SCRIPT\_NAME

 Make use of Command History window to look for commands that were previously used.

# Loops & Conditional Statements

#### Loop Control Statements - for

**for** statements help repeatedly execute a block of code for a certain number of iterations

```
x = zeros(1,10);
for n = 1 : 10
     x(n) = n;
end
```

#### Loop Control Statements - while

while statements repeatedly execute a block of code as long as a condition is satisfied.

#### **Conditional Statements**

#### Execute statements if condition is true

if expression
 statements
elseif expression
 statements
else
 statements
end

```
if a>10
    disp('a > 10');
elseif a<10
    disp('a < 10')
else
    disp('a = 10')
end
```

#### **Nested-Loop: Simple Example**

for r = 1:4
 for c = 1:4
 fprintf('r = %i and c = %i\n', r, c);
 end

end

#### **Adding Break Statements**

```
What if we add a break statement in the outer loop?
 for r = 1:4
     for c = 1:4
         fprintf('r = \% and c = \% (n', r, c);
     end
     if r == 2
       break;
     end
 end
```

#### **Adding Break Statements**

What if we add a break statement in the inner loop?

```
for r = 1:4
    for c = 1:4
        if r == 2
            break;
        end
            fprintf('r = %i and c = %i\n', r, c);
    end
end
```

#### **Exercise: Output**

Write a script that will display each of the following shapes using asterisks \*

Solid Square	Open Square	Triangle
* * * * *	* * * * *	
* * * * *	* *	* * * * * * *
* * * * *	* *	* * * * *
* * * * *	* *	* * *
****	* * * * *	*

## Appendix

## Terminology

- A **bit** is short for **bi**nary digit. It has only two possible values: On (1) or Off (0).
- A byte is simply a string of 8 bits.
- A kilobyte (KB) is 1,024 (2^10) bytes.
- A megabyte (MB) is 1,024 KB or 1,024^2 bytes.
- A gigabyte (GB) is 1,024 MB or 1,024^3 bytes.

## Data Types: double and single

A double uses 64 bits to store a number.

- A single uses 32 bits to store a number.

 Doubles and singles can be used to represent both integers and non-integers.

#### **How Computers Store Variables**

Suppose we type the following commands in MATLAB:

We know MATLAB stores the values associated with the variables, y and Day, in memory. How are these values stored?

#### **How Computers Store Variables**

Computers store all data (numbers, letters, instructions, ...) as strings of 1s and 0s (bits).

A **bit** is short for **bi**nary digit. It has only two possible values: On (1) or Off (0).
